5-10 Minute Briefings on Vancouver Weather

To create your weather briefing, follow through the steps below, using the links as instructed. (*Prepare before presenting - open links and have them ready to go*)

Step 1. Big picture: Planetary and Synoptic Scales. (2-3 minutes)

- <u>Satellite imaging</u> Show the clouds over Vancouver's part of North America, and make one or two comments.
- <u>Surface Pressure Map and Frontal Boundaries</u> look for *today's* high/low pressure centers, and frontal boundaries that are relevant for current or past Vancouver weather, and then follow these directions:

1. Discuss where the high/low pressure are centers today that are relevant for Vancouver.

2. Point out where the frontal boundaries lie on the map (Cold front = Strong winds, heavy precipitation, cooling temperatures) (Warm front = light winds, light to medium precipitation, warming temperatures) for those fronts relevant for Vancouver.

- <u>25 kPa Winds / Pressure</u> - look for ridges and troughs in the jet stream - the narrow band of high winds over North America and the northeast Pacific ocean - then follow these directions:

1. Discuss if the jet stream is forming a ridge, trough, or zonal flow over or near Vancouver.

2. Show how this changes or evolves over the next few days.

 50 kPa Geopotential Height (<u>Anomaly</u>) - look for regions of anomalously high and low geopotential heights (red = high pressure and blue = low pressure), and then follow these directions:

1. Point out the locations of high/low geopotential height centers over North America **today**, focusing on ones relevant to Vancouver weather.

- 2. Discuss if they stay stationary or if they move.
- 3. Show how they change over time.
- <u>2 meter Temperature Anomaly</u> look for regions that have unseasonably high and low temperatures (red and blue, respectively) as are (or will) affect Vancouver. Compare these regions to the locations of high and low 50 kPa geopotential heights (the last link), and then follow these directions:
 - 1. Point out the hotter regions, and the cooler regions.
 - 2. Discuss the extremity of the anomalies.
 - 3. Show how they move/change over the next few days, comparing the change to the movement of the 50 kPa geopotential height anomaly systems.

Step 2. Close to home. Mesoscale and Regional/Local Scales. (2-3 minutes)

Mean Sea Level Pressure and 10m Winds - look at the pressure and winds over the next
2-3 days, and then follow these directions: (Where are the winds coming from, how will this impact the weather coming up?)

1. Point out the high/low pressure centres that exist **today**, relevant for Vancouver.

2. Discuss how they move over the following 2-3 days.

- 3. Show winds over Vancouver today, considering their direction and speed.
- 4. Discuss how they evolve over the next few days (windspeed, wind direction).
- <u>2m Temperature</u> look at the ground level temperatures in and around Vancouver over the next 2-3 days, and then follow these directions:

1. Show if the temperatures at 00z are getting higher, lower, or staying the same. (compare between the next few days)

2. Are the temperatures at 12z higher, lower, or staying the same? (compare between the next few days)

3. Relate these temperature forecasts to the wind forecasts (last link). Discuss any overlap that exists.

- <u>3-hr Precipitation</u> look at the 3 hour accumulated precipitation over the next 2-3 days in and near Vancouver, and then follow these directions:
 - 1. Point out the date and time that rain is forecasted to occur.
 - 2. Discuss the strength of the rain (rain rates), and how long it lasts.
- <u>Accumulated Precipitation</u> look at this over the next 2-3 days for in and near Vancouver, and then follow these directions:
 - 1. Show the total precipitation that Vancouver will get in the next 2-3 days.

2. Discuss trends in the precipitation, noting if it falls evenly throughout the region, or if it falls over the mountain's only.

- <u>Accumulated Snowfall</u> - look at this over the next 2-3 days for in and near Vancouver (and at Whistler and/or other popular ski resorts), and then follow these directions:

1. Discuss the total snow that Vancouver (and ski resorts, if appropriate) will get in the next 2-3 days, pointing out regions with the heaviest snow.

- <u>Smoke forecast</u> look at the BlueSky wildfire smoke forecast over the next 2 days, and then follow these directions:
 - 1. Show the surface level smoke forecasted for Vancouver.
 - 2. Discuss which fires any smoke may be coming from.

Step 3. UBC specific weather: (2-3 minutes)

 <u>UBC Rooftop Cameras</u> - Look at the rooftop cameras and point out what the current UBC weather looks like.

- <u>Radar</u> Look at the current radar over Vancouver, and discuss any precipitation that is falling. Point out if the rain rate is heavy (high dBZ) or light (low dBZ).
- UBC Forecast (<u>3 day</u>) Look at the 3 day UBC rooftop weather forecast, and then follow these directions:

1. Point out the maximum and minimum temperatures tomorrow, and the day after.

2. Point out how much rain (in mm) will fall tomorrow, and the day after.

3. Discuss what the weather will look like for the next two days (sunny, cloudy, windy).

Step 4. News (optional if you have enough time left): (1-2 minutes)

Find a news story about a weather event, preferably an event driven by *synoptic scale weather systems!* Widespread drought? Atmospheric rivers and flooding? Fires and chaos? Go for it!

We recommend you find a news story on a relevant news website, such as <u>Wildfire Today</u>, <u>NASA Earth Observatory</u>, <u>Cliff Mass Weather Blog</u>, or <u>RAMMB-Cira Satellite Library</u>.

After giving a *very very brief* introduction to the weather event, choose *one* way to show the event using a weather observation tool. This tool should be used to show what makes the weather event newsworthy - such as the rain rate of a severe storm, or the wind speeds of a hurricane, or the size and growth of a wildfire. (i.e. use only **ONE** of the following links)

- <u>Zoom Earth</u> (track hurricanes and see global radar, global satellite images)
- <u>Windy</u> (see surface **wind speed** and **wind direction** globally). Also see <u>Pivotal</u>, and <u>Ventusky</u>, and <u>Earth nullschool</u>.
- Northwest Weather Radar (U. Washington)
- <u>Canadian Historical Weather Radar</u> (Weather radar in Canada)
- <u>Fire Information for Resources Management System (FIRMS)</u> (Fire detections from satellites)
- <u>Blitzortung</u> (Lightning map, either <u>historical</u> or <u>real-time</u>)
- <u>NASA Worldview</u> (Polar orbiting **satellites**)
- <u>RAMMB Satellite Imagery</u> (Geostationary satellites)
- <u>Weather Satellites zoomed to the Pacific Northwest</u> (U. Washington)
